AMMAN SMART CITY

Project Documentation

Prepared by:

- Eltayyeb Ali Alzoubi
- Kareem Hijazi

Date: 9 November 2026

1. Project Overview

Amman Smart City is a developing digital platform designed to provide residents, tourists, and potential investors with convenient access to information about Amman, Jordan.

The project aims to bring essential city information into one accessible website, helping users explore attractions, discover public services, learn about transportation, and understand the city's history. It primarily targets international tourists and foreign investors while also serving local residents.

The website currently consists of six main pages: Home, Services, Transportation, Events, History, and Contact. Together, these pages introduce the city, highlight digital government services, provide transportation information, showcase local events, present historical landmarks, and offer contact details.

The team selected this project because of its potential for continuous development and future expansion. The long-term goal is to transform the website into a more interactive smart city platform, potentially incorporating transportation booking, integrated digital services, and information about investment opportunities.

The team also hopes to explore future collaboration with organizations such as the Greater Amman Municipality, supporting Amman's digital transformation and improving the experience of residents and visitors.

2. Team Members & Roles

The Amman Smart City project was developed by two team members, with responsibilities divided as follows:

Eltayyeb Ali Alzoubi

- Created the GitHub repository and uploaded the project.
- Developed the website's header and footer.
- Developed the Home, Services, and History pages.

Kareem Hijazi

- Developed the Transportation, Events, and Contact pages.

Work Distribution

The six website pages were divided equally between the two team members, with each member responsible for developing three pages. Altieb also handled the GitHub repository setup and the shared header and footer.

3. Pages Description

3.1 Home Page

The Home page introduces Amman Smart City through a background video showcasing Amman and four informational cards covering the city, the smart city concept, the project's vision, and Amman's future. Each card links to a more detailed section, with additional navigation to relevant pages such as History, Services, Events, and Transportation.

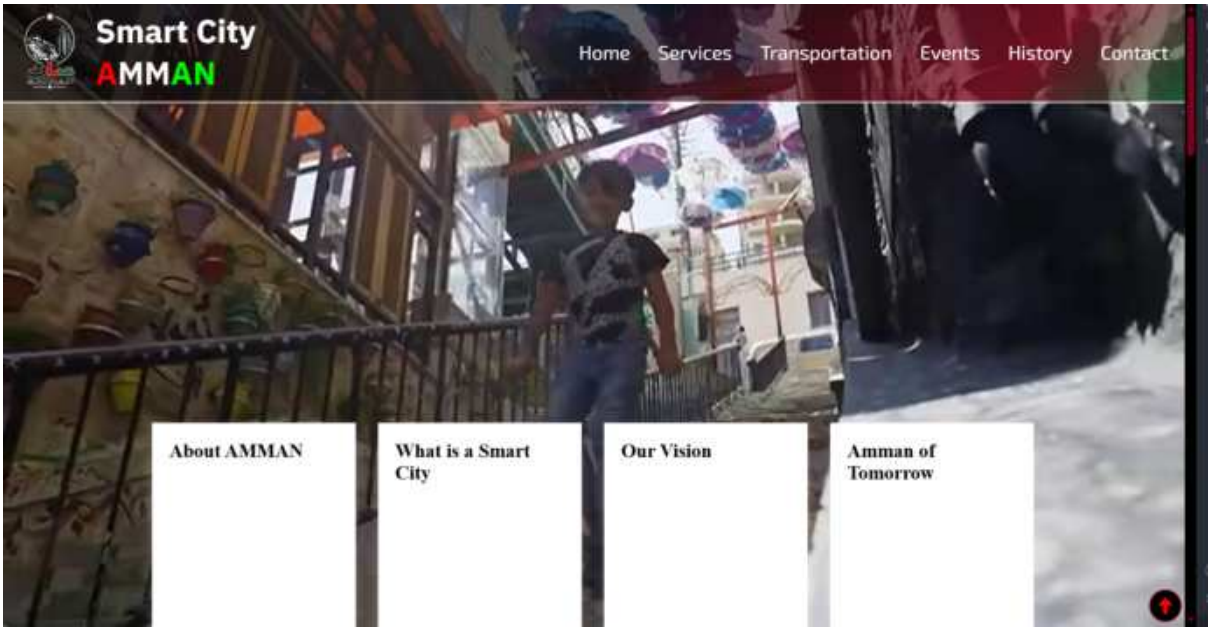

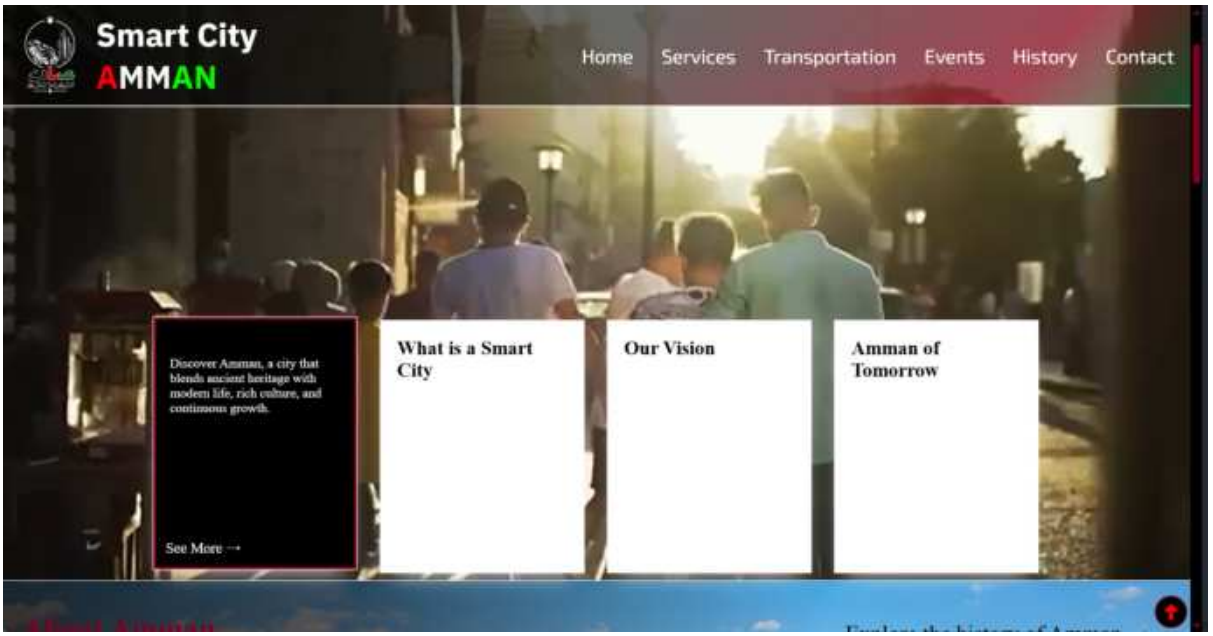

Figure 2: Home page card displaying additional information through a CSS hover effect.

3.2 Services Page

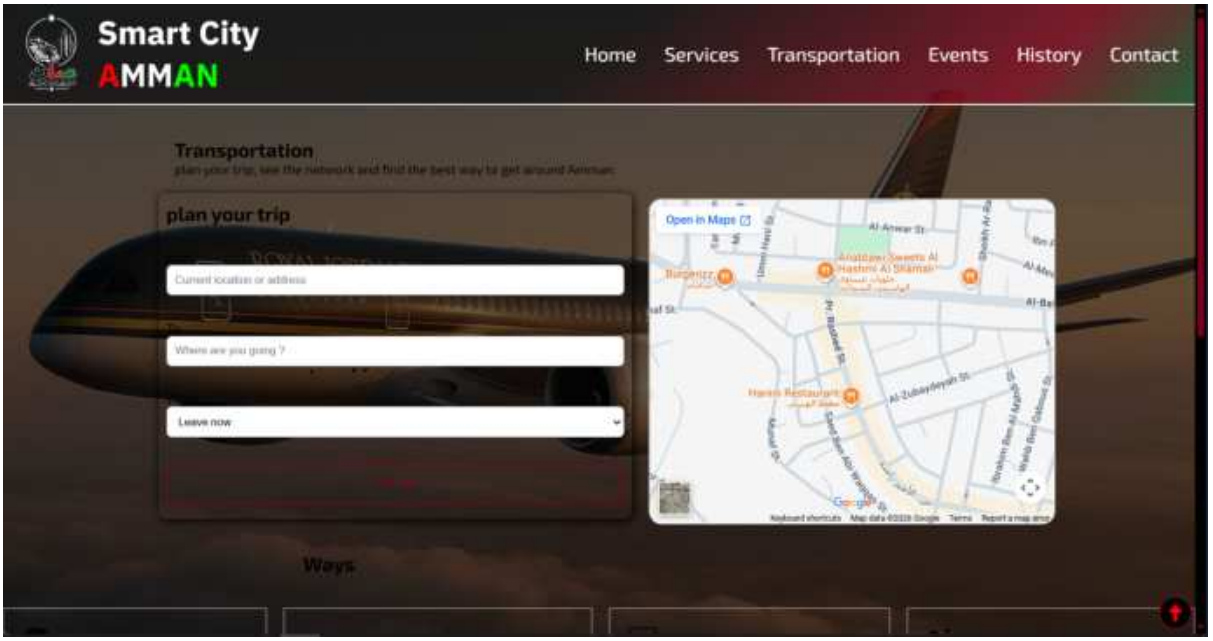

The Services page highlights Jordan's digital transformation through six statistical cards presenting key figures related to electronic services, digital identities, and digital payments.

It also introduces the Sanad application, explaining its digital identity features, access to government services, and digital documents. The section includes an application image and a link to the official Sanad website.

3.3 Transportation Page

The Transportation page introduces transportation options in Amman through a trip-planning interface and an embedded Google Maps view. It also features four informational cards covering public transportation, on-demand transport, parking facilities, and walking and cycling.

3.4 Events Page

The Events page allows visitors to explore events and activities in Amman through a search bar and event listings. It features a highlighted event, Open Air Cinema Night, with an image and buttons for reservations and additional details.

The page also includes three smaller event cards displaying information such as event dates, locations, prices, and links to further details.

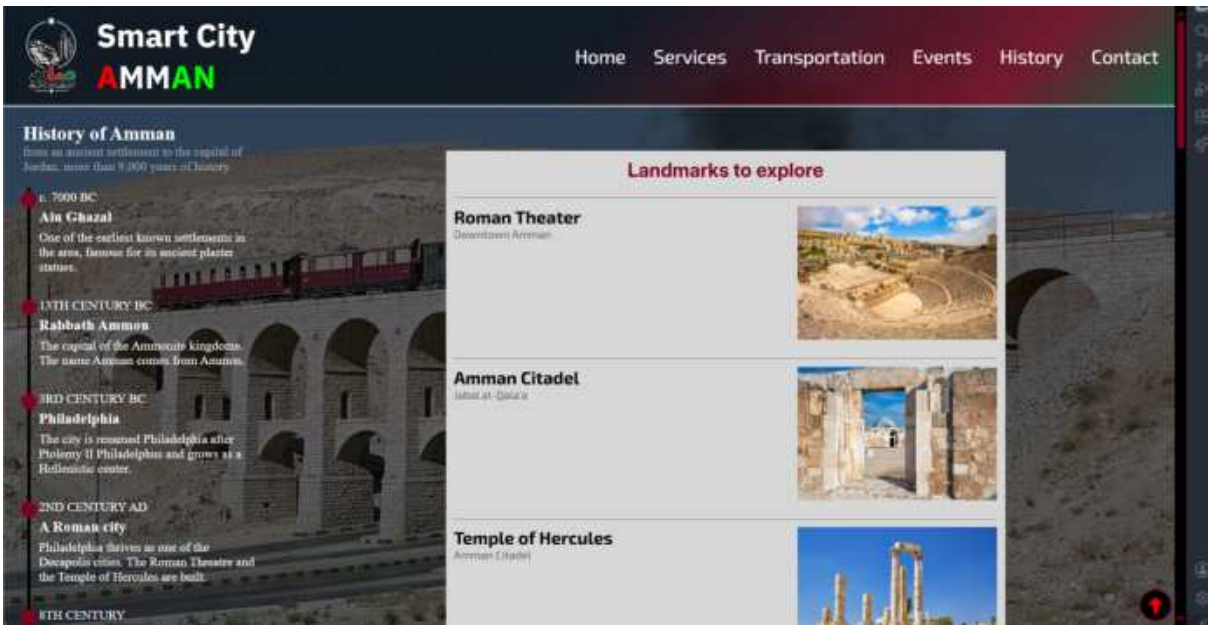

3.5 History Page

The History page explores Amman's history, from its ancient beginnings to the modern capital of Jordan, through an illustrated timeline highlighting major historical periods and events.

It also features a Landmarks to Explore section showcasing five historical attractions with interactive images and a Plan Your Visit button.

Additionally, the page includes a gallery of six historical landmarks with hover effects that reveal brief descriptions of each location.

Figure 4: History page displaying the historical timeline and landmarks to explore.

3.6 Contact Page

The Contact page presents a contact form where visitors can enter their name, email address, subject, and message.

It also provides alternative contact information, including a phone number, email address, office location, and working hours.

Additionally, the page includes an emergency notice advising visitors to contact emergency services directly, along with a dedicated Emergency button.

4. Design Choices

Color Palette

The website uses a modern color palette inspired by Jordan's national identity, featuring green, black, red, white, and burgundy. Different shades of these colors, including dark green (#008800), were selected to create a contemporary visual style while reflecting Jordanian identity.

Typography

The website uses Inter, Exo 2, and IBM Plex Sans fonts to create a modern, futuristic appearance that reflects the smart city concept while maintaining clear and readable text.

Layout & Spacing

The website primarily uses a card-based layout to organize information into clear, easy-to-navigate sections. The History page also features a timeline and interactive image galleries to present historical content.

Spacing was adjusted according to each section's needs to maintain visual balance, readability, and a comfortable browsing experience without overcrowding or excessive empty space.

Target Audience & Usability

The website is designed to provide a simple and intuitive browsing experience, particularly for tourists, visitors, and potential investors. The Home page introduces key topics through informational cards, with clear links to related sections and pages. A consistent navigation header across the website helps users find information quickly and easily.

5. Technologies Used

The Amman Smart City website was developed using the following technologies and tools:

- HTML: Used to structure the website's pages and organize their content.
- CSS: Used to style the website, including colors, fonts, layouts, and responsive design.
- Visual Studio Code: Used as the code editor for developing and editing the website.
- Git & GitHub: Used for version control, sharing code, and enabling team members to collaborate on the same project.

6. Layout Explanation

Flexbox & Grid

The website uses CSS Flexbox and Grid to organize content efficiently. Flexbox was mainly used to align cards, arrange content within sections, and manage spacing, particularly on the Home and History pages.

CSS Grid was used for sections requiring more structured layouts, such as the Services, Transportation, Events, and Contact pages. Both techniques were selected according to each section's layout requirements.

Box Model

The CSS Box Model was used to maintain proper spacing and alignment throughout the website. Padding provided space within cards and sections, while margins helped separate elements and adjust their positioning. Borders were used selectively to distinguish the header, footer, sections, and certain cards.

Header & Navigation

The website features a sticky, semi-transparent header containing the Smart City Amman logo and navigation links to all six pages. The logo links to the Home page, and the header remains visible while scrolling.

On mobile devices, the navigation changes into a hamburger menu that opens a sidebar containing the same links.

Footer

The footer includes the project logo, a short vision statement, social media links, quick navigation links, city service shortcuts, contact information, and an email updates field.

It also displays the 2026 copyright notice and adapts its layout for mobile devices. A fixed back-to-top button is available on all pages, allowing users to return to the top easily.

7. Responsive Design

The website uses CSS Media Queries to adapt its layout to different screen sizes, ensuring a comfortable browsing experience across desktops, tablets, and mobile devices.

Two main breakpoints were implemented:

- 900px and below: Layouts, card arrangements, and spacing were adjusted to accommodate
- 600px and below: Content was reorganized for mobile devices, with cards displayed vertically, a hamburger navigation menu, and a vertically arranged footer.

Flexbox and CSS Grid were used alongside Media Queries to maintain consistent alignment, readability, and usability across different devices.

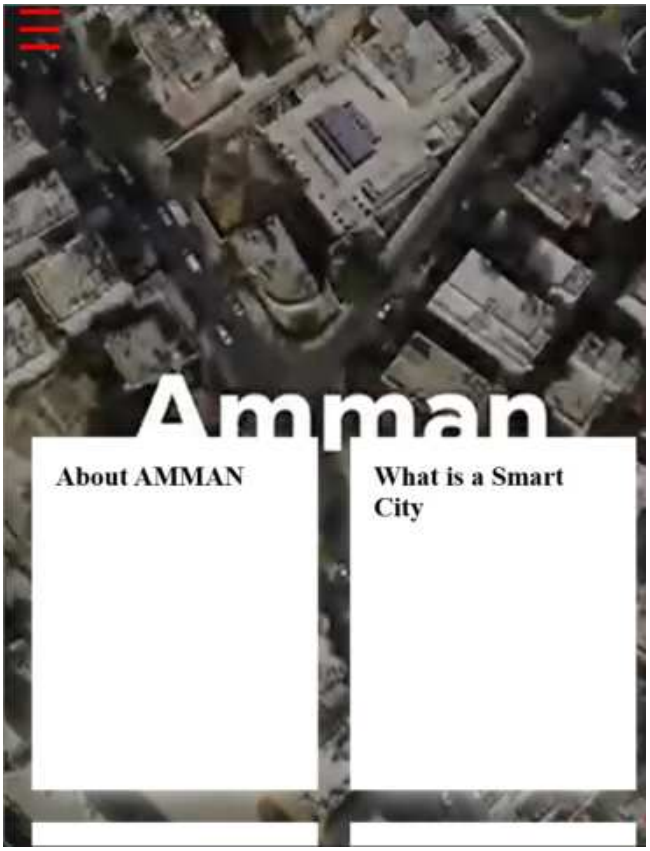

Figure 6: Mobile sidebar navigation showing the logo and page links.

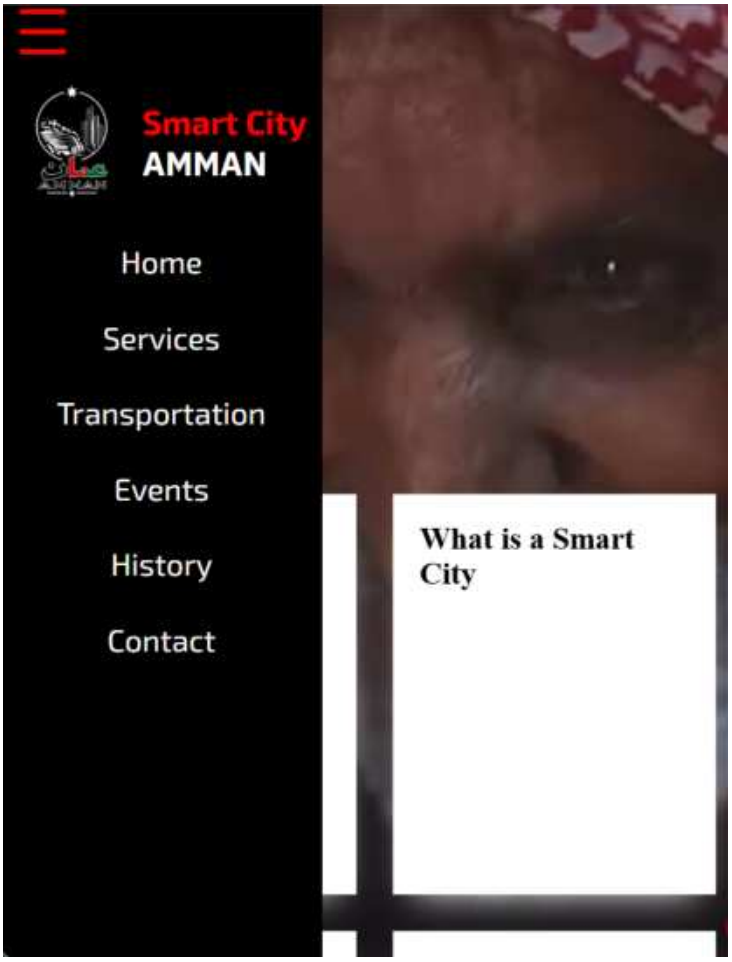

Figure 7: Mobile footer showing vertically arranged navigation and service links.

8. Challenges Faced

During the development of Amman Smart City, the team faced several challenges:

Team Collaboration: Combining code from different team members was initially difficult. The team learned Git and GitHub to manage changes and collaborate effectively.

Responsive Video Background: Adjusting the Home page's background video for different screen sizes required CSS modifications, including positioning and object-fit.

CSS Layout & Positioning: Aligning elements and organizing cards required experimentation with Flexbox and Grid, along with knowledge sharing between team members.

These challenges improved the team's problem-solving, collaboration, and web development skills.

9. Conclusion

The Amman Smart City project provided the team with valuable experience in web development, responsive design, teamwork, and version control using Git and GitHub.

The project represents an initial step toward creating a comprehensive digital platform that makes information about Amman more accessible to tourists, potential investors, and residents.

In the future, the team aims to expand the website with interactive features, transportation booking, integrated digital services, and investment opportunities. The long-term vision also includes exploring potential collaboration with the Greater Amman Municipality to support Amman's digital transformation.

Overall, the project established a foundation for future development while strengthening the team's technical and collaborative skills.
